## Zeros and Poles

**Definition 1** (Zero). If f is holomorphic in a neighborhood of  $z_0 \in \mathbb{C}$  and  $f(z_0) = 0$ , we can write, for some  $k \in \mathbb{N}$ ,

$$f(z) = (z - z_0)^k f_1(z)$$

where  $f_1(z)$  is nonvanishing near  $z_0$ . In this case k is called the **order** or **multiplicity** of the **zero**  $z_0$ 

Zeros of holomorphic functions form a discrete set. We want to study, however, not only holomorphic functions, but also quotients of holomorphic functions

**Definition 2** (Meromorphic). A function f is **meromorphic** on an open  $\Omega \subseteq \mathbb{C}$  if it is defined and holomorphic in the complement of a discrete set such that in some neighborhood of every point of  $\Omega$  we can write f(z) = g(z)/h(z) where g, h are holomorphic and h is not identically zero.
